           http://www.nih.go.jp/-jun/cgi-bin/frameplot.pl. Where possible we chose an initiation codon (arg, gg; ctg or ttg) which is preceded by an upstream ribosome binding site sequence (optimally 5-13 bp before the initiation codon). If this could not be identified we chose the most upstream initiation codon.

Three fourths of the pSiA2-i. DNA are occupied by biosynthetic genes (three PKS gene clusters for lankacidin, lankamycin and an unknown type II polyketide, a carotennid biosynthetic gene clustery genes and others). The range of each biosynthetic gene cluster has been deduced by comparison with similar gene clusters
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /codon start=1
